Q: Initializing std::string by const char*, why casting is needed? When you have: const char *chars = "abcd"; std::string s(chars); The s string isn't initialized with all values set. You have to cast before assigning a value: std::string s(chars); s = "xyz"; This works: std::string s(static_cast(chars)); s = "xyz"; Is there any reason for this? A: The static type of chars is const char * which is a pointer, but std::string::value_type is std::string::pointer. The conversion to pointer is so needed that the
