Featured image via You've probably heard people say that Photoshop is a great way to "fix" photos, but what does it really do? How is it that we use it all the time for fixing everyday scenes? How do I use it to make my photos look better? 1. They're "fixer upper" One of the most common uses for Photoshop is to fix scratches and blemishes on photos. These can be easily repaired with a few basic steps. 1. Open a photo and make sure that all of the white balance settings are set to auto. 2. Select the "lasso tool" by clicking twice on the tool's icon in the bottom left hand corner of the window. 3. Click on the blemish in the photo and drag it around the picture. 4. Be sure to use a very small, soft brush that will not alter the photo's details while saving it. 5. To fix a scratch or blemish, drag the brush along the spot you want to remove. 6. Right click or press CTRL-Z to undo your last step. 7. Save your project and post it! 2. Add some visual interest with selective cropping As much as we all love the idea of having a massive panoramic image of our families, friends or places we love, it's just not feasible to cover that much real estate with a single image. Adding a few "moments" to capture with a DSLR camera and some tripod or Steadycam, can not only save you time but make the image you create more memorable as well. 1. Open your original photo. 2. Use your lasso tool and select a portion of the photo you wish to crop out. 3. Try not to waste the image's dynamic range by cropping it too wide, otherwise the highlights will be lost. 4. Create a new layer and move it to the top of the image. 5. Click on your new layer and press CTRL-C, then CTRL-V to copy the active layer. 6. Delete the original layer. 7. Press CTRL-SHIFT-T to transform the top layer, then press CTRL-E to expand the stroke of the crop to the size of the background. 8. Save your project.

Q: How does one connect to a MySQL DB with Heroku? I'm trying to connect to a MySQL DB on Heroku. I've gotten a login, and for some reason Heroku doesn't seem to want to set any of the source options. $ heroku config === HEROKU_POSTGRESQL_CONFIG MYSQL_ROOT_PASSWORD: password HEROKU_DATABASE: myapp HEROKU_DATABASE_URL: jdbc:mysql://localhost:3306/myapp? useSSL=false user=myapp password=password A: To connect to Postgres on Heroku, you need to configure Heroku Postgres as a data source. To do that, in your Procfile, edit the section of the call that executes your app. In my example, I've declared heroku pg:sprockets: worker: bundle exec rake assets:precompile worker: bundle exec rails server In this example, I've used database:sandbox, but you could replace it with whatever your Heroku Postgres database is called. To ensure that you're connecting to your database on Heroku, you should also try to connect to the same environment as the Heroku Postgres database is using, by adding : DATABASE_URL=postgres://postgres:password@localhost:5432/sandbox_dev To test this, run heroku pg:info. If it's at the bottom of the output, like your example, you'll be using the database. If it's not, then your configuration is not correct and you'll have to try to fix it. If this doesn't work, you'll also need to edit the DATABASE_URL environment variable in your project, if it exists. You can read more about Heroku Postgres configuration on their documentation page. It's the final day of 'Willy Wonka and the Chocolate Factory' screening at the Disney-MGM Studios. Fans are excited to see what will happen next as Wonka and his workers search the factory for the golden ticket. Whether or not they will be successful in finding the golden ticket will be revealed at the final screening of 'Willy Wonka and the Chocolate Factory' on the Studio
