Downloads Reviews If the website asking for account login on that website, the login credentials are sent in an encrypted way. The software is a lightweight program that decrypts the login credentials and provides you with the username and password. I recently ran across a website that required a login to access their account info. This website can only be accessed via chrome and there's only a key on the tab when I tried to access it. I couldn't get into the website at all. So I did what I always do - tried using something else. I tried to install the password breaker on Windows, but that didn't work. Then I thought I'd try opening the file using a hex editor to see if I could open the file and read the information in the account (briefly before the site asked for me to enter the login info). I tried that as well but didn't get very far. Then I searched for some software that could help and found Password Decoder. I knew it wouldn't work but it was the first thing I thought of. The program runs just fine and retrieves the username/password for the account and when I test the username/password, it is valid. So, I think this software is a keeper. I'm pretty sure the website was asking for information
