HIGHLIGHTS AutoCAD is a state-of-the-art CAD application that combines powerful 3D tools with powerful 2D drafting tools. It was the first CAD application to use parametric modeling and is the most widely used of these tools. It is the industry standard for preparing architectural and engineering drawings for construction projects. Some of the most widely used 2D drafting tools in AutoCAD are the 2D polyline and drawing tools, the page layout tools, the orthographic projections tools, and the section tools. These tools are integrated into 2D drawing views to make it easier to create 2D and 3D objects such as arrows, floor plans, house elevations, sections, and architectural and engineering drawings. The 3D tools in AutoCAD are among the best in the industry. These tools include the 3D command set, surface modeling, topology, and the 3D drawing views. AutoCAD includes a wide variety of filters and tools to help the user edit and modify objects. AutoCAD is compatible with most major CAD applications. Below is a list of the top 10 AutoCAD features. COMPATIBILITY AutoCAD is compatible with most major CAD applications including MicroStation, Bentley Architecture, Creo, Meca, SolidWorks, Inventor, and VectorWorks. SCALING AutoCAD uses a parameterized, floating-point dimensional model. The floating-point dimensional model allows the user to freely scale the design during object editing. AutoCAD is a 100 percent floating-point dimensional application. The floating-point dimensional model allows the user to freely scale the design during object editing. The floating-point dimensional model allows the user to freely scale the design during object editing. All dimensions in AutoCAD are based on the same base units, the AutoCAD point. The AutoCAD point equals one/72 of an inch. It is approximately equal to the typographic point (one/72 of a point) found in conventional drafting software. AutoCAD displays three digits for the AutoCAD point. The AutoCAD point equals one/72 of an inch. Next Stop, Mexico, via Anchorage I'm in Anchorage right now, at the very end of the Trans-Alaska Pipeline. It's not quite the end, but I can't take my car any farther south -- it's full of oil and will run out of gas before it reaches the Pacific Ocean. So I'll be on a ship until I get there. I've been traveling for a couple of weeks, and just got off of a ride on the Transit of the Aug. 9th Alaska Air Show. We went up the beautiful Inside Passage, and then crossed over the great Chukchi Sea, and we started climbing north along the Alaskan mountains. It was a pretty interesting flight. All of the young pilots said they'd never been on a 727 before -- there are only 14 of those left in the world. We came in over some rivers and lakes and then across that really flat, featureless part of Alaska -- from there it was up and over the mountains, and then we just skirted the coastline for a couple of hours. I also got to see some wildlife -- a grizzly bear, a wolf, a couple of bald eagles and a bunch of humpbacks. It was pretty cool. Anyway, I'll be off to the USS Anchorage tonight. Anchorage is one of the cities on the west coast of Mexico -- it's a town that didn't exist until the US built the Panama Canal, and it's named after President McKinley. The USS Anchorage is the ninth and largest of ten Escort Squadron ships, and it's built in San Diego, and her homeport is Bremerton, Washington. She's got a diesel plant, and a bunch of other cool stuff, but I just want to be able to stay in my room and not have to deal with any of that stuff. I'm going to be on a ship, so that's the most exciting thing I could get. I can't tell you much about the ship. I haven't been on it before, and I don't know much about it. I'm just going to be sleeping in a nice warm bed and have a hot shower. It's gonna be pretty interesting, though. The first person that I'll see after I leave the ship will be the pilot who brought me down from Fairbanks. Hey, I've been thinking a lot about stuff that I've written about in the past. We should try to
