Tiny Gorgon - A Super Mario Bros remake for Android and iOS available nowMore In This Article Chronic immune activation as a cause of autoimmunity and cancer. Cancer immunosurveillance T-regulatory cells Overview Although T-cell tolerance is essential for optimal adaptive immunity, the normal immune system must also avoid overactive immune responses or autoimmunity. The delicate balance between these competing forces is exquisitely controlled, so that T-cell responses can be precisely triggered when needed and terminated once the threat is removed. This is achieved by a number of mechanisms, including the action of specialized immune cells called regulatory T cells (T-regs), or by the production of cytokines that dampen immune responses.The T-regs are of two distinct types: naturally occurring T-regs and induced T-regs. Naturally occurring T-regs can be derived from the thymus or can home to the tissues where they perform their specialized functions. They can be activated to become regulatory cells by various signals, such as antigens or cytokines. Induced T-regs can be made in the periphery and can only function peripherally. It has recently been shown that myeloid-derived suppressive cells, a new T-reg subset, are naturally occurring or induced T-regs.The role of the regulatory cells in suppressing unwanted activation of T cells, and in maintaining immune tolerance to self, is essential for efficient immune system function. Disorders of regulation, including autoimmune, allergic, and other inflammatory conditions, result from an imbalance of immune activity that can be partially corrected by restoring proper regulation.
