About Meta Tools Meta Tools is a software company founded in May, 2001 by Frank Gryzan and Dave Engberg. It was established and began operations in Eagan, Minnesota, a suburb of Minneapolis. The company has since expanded to Atlanta, Georgia, and is currently developing a presence in Pittsburgh, Pennsylvania. The Company has offices in approximately 20 locations. Meta Tools provides public access to a family of privately held, cross-platform, web-based software tools that automate the process of creating software libraries, including frameworks, SDKs, and libraries. It is a middleware, allowing for fast and easy deployment of these libraries in a variety of programming languages. Meta Tools serves as a "one stop shop" for public access to code libraries for languages like Visual Basic, Delphi, C#,.NET and Java. Aside from greatly simplifying the process of creating libraries, the software also provides the rapid deployment of libraries as standalone, applet-based applications, and web-based applications. Meta Tools was incorporated on April 4, 2009 as a Minnesota non-profit corporation. Predicting the Future The number of hardware platforms that developers can target with an IDE and SDK in a short time is now growing exponentially. Several companies are moving beyond what is possible on one platform to support multiple ones. As a result, C# will become the primary language for end-users looking to program for the Windows platform. Following the trend of diversifying developer tools, Meta Tools and its parent company, AnswerIT, are also placing bets on the future of the multiplatform development community. Specifically, they foresee a strong demand for applications that are written using multiple languages, with the ability to code to one platform from another. This requires the use of libraries and frameworks like InterCode, which are part of Meta Tools' ongoing development. Patient safety is a global priority, as highlighted in the World Health Organization (WHO) 'Safe Surgery Saves Lives: A Report of the World Health Assembly' and in the Institute of Medicine (IOM)'s 'To err is human: building a safer health system', both of which emphasize the need to improve patient safety. To measure the safety of anaesthesia care at a teaching hospital in Cape Town, South Africa. A descriptive study design using data collected over a nine month period in a multi-disciplinary, single-level, tertiary level university teaching hospital. Patients and their families and professional anaesthetists at a university teaching hospital in Cape Town, South Africa. A self-administered questionnaire, modified from the validated American Society of Anaesthesiologists Safety Attitude Survey, was used to evaluate individual, team and organizational factors that could affect patient safety. The Safety Attitude Survey, used to evaluate patient safety culture, revealed an

overall score of 65.48%. All survey subscores were below 80%, with the medical record and the physical environment subscores being the lowest. Overall, 95.3% of participants agreed/strongly agreed that patient safety is important, and 52% disagreed/strongly disagreed that a lack of time or resources were factors in patient safety. The overall score, medical record and physical environment subscores were below 80%, while the teamwork, supervision and quality of care subscores were higher than 80%. The results show a need for improvement in patient safety culture in the anaesthetic practice environment.32.ref023]\]. ![Mechanism of action of endothelial nitric oxide synthase (eNOS) expression on BMSC survival.\ The figure illustrates the mechanism by which eNOS expression by BMSC promotes survival. β-catenin, a protein that activates the transcription of genes that enhance cell survival, is a target of the PI3K-Akt signaling pathway, which is in turn controlled by the eNOS/calcitonin gene-related peptide (CGRP) pathway.](pone.0087032.g001){#pone-0087032-g001} We thank Dr. Raffaella Lenci and Dr. Vercell
