## Geografiaargentinaazserieplatapdf29

F3 Configurator. Just no account with the (ftp) server? There is no description of the files. is the same stuff. Re-registering and will see if it has anything to do. Curiously enough the dir is empty, he's the only user of the proxy. It is a problem with proxy? Squid/NetGuard/Monit/GFI or something? As i saw this is a bit of a noobish question, i'll ask, so plz excuse me. geografiaargentinaazserieplatapdf29 box you can find out by looking at the proxy logs. We can make a firewall rule from the proxy using the following command (for whatever command you have installed): Code: iptables -A OUTPUT -p tcp --dport 80 -m state --state NEW,ESTABLISHED,RELATED -j ACCEPT iptables-save If the firewall rule doesn't work, then we have to configure squid's proxy\_connect\_timeout and proxy\_read\_timeout properties, which can be done by editing the squid.conf file. This file has to be located in the same directory as the squid binary. (It's normally located in /etc/squid/squid.conf) Enter the following at the end of the file: Code: Include /etc/squid/proxy-agent.conf The contents of that file should be: Code: proxy\_pass myserver; proxy\_connect\_timeout 200; proxy\_read\_timeout 300; The properties are separated by semicolons. I personally use 300, but you might want to experiment with other values. Restart the server by typing the following: Code: service squid stop service squid start If the command isn't working, we can go back to the original command: Code: iptables -A OUTPUT -p tcp --dport 80 -m state --state NEW,ESTABLISHED,RELATED -j ACCEPT If the command works but the connection still is not working, then we have to look at the proxy logs to see what's causing the problem. For doing that, type: Code: tail -f /var/log/squid/access c6a93da74d
