
Delcam PowerMill 10 SP6 PowerMill 2010 RC1 \\FREE\\

A feature new in version 2.1 of PowerMILL is the ability to create separate toolpaths in an IntelliCAM workcell. IntelliCAM workcells are powerful, at the same time, the user can customise, each cell in a PowerMILL workcell to have its own settings. This is very useful for multi-axis milling, where the same entry and exit points can be used, but the milling can be greatly influenced by the work cell. As well as opening up a multitude of different ways of using a PowerMILL spindle. In addition, the application and machine are being developed in parallel; this is reflected in PowerMILL being the first to experience all of the new features that have been implemented in its CAM software. Delcam has therefore created a CAM software that is flexible and also easy to understand for the user who is not a skilled CAD programmer, the software has also been designed so that it integrates with all of the available third party CAM software on the market. PowerMILL has been using IntelliCAM technology since Delcam's acquisition of IntelliCAM. The toolbox also allows the use of all of Delcam's other technologies, including Strokecam, Pendant, BFC and OptimalPath. A CAM solution needs to be accessible to all users, within all departments, with a convenient, simple to use GUI. For this reason, Delcam PowerMill has chosen to create a software product that is easy to use, intuitive and has a familiar interface. Delcam PowerMill does not use the Windows operating system which has been the basis for many software products. It has been created using the Motif development toolkit, a simple toolkit that provides rapid and intuitive development. The software does not use any particular scripting language, which enables the designer to understand the code.

Delcam PowerMill 10 SP6 PowerMill 2010 RC1

With its ability to perform programming via touch screen or program bar, PowerMill has long been the most productive tool and the one that users feel most confident programming. In PowerMill 2010 this has been improved further with a number of new user-focused enhancements. For one, users can now touch the workpiece and the machine will automatically issue the command (this was previously a function of PowerMill Basic). This is done by assigning the touch point as a virtual touch screen control point and setting the machine to recognise touches as commands. Second, programming becomes more accessible by providing a colour-coding system that makes it easy to recognise the different dimensions and parameter sets that the user is using. Third, the dialog boxes are a lot less complex than they have been in the past and are much easier to get to grips with, allowing rapid learning. In addition to these enhancements the programmers have made significant improvements to the way PowerMill operates. The first big change is that the system now accesses the NC memory directly and can save and load data structures directly, rather than through a workspace as was done in the past. This has the knock-on effect of making it much easier to maintain and expand PowerMills memory base. Moreover, with this change a large number of functionality enhancements can be made, such as the ability to hold arbitrary shapes, keep track of embedded surfaces and perform advanced data pick-up and pick-up off the workpiece. These are just the highlights for PowerMill 2010. In addition to these enhancements there is a new machining library for milling and boring that allows all the key machining parameters to be defined in an XML file. This allows the definition to be shared within the factory, helping engineers to make rapid changes to the way the machines operate. There is also a number of new toolpath algorithms and interface

enhancements. The main one being the ability to select either a minimum root-mean-square error, root-mean-square path or zero-length path. 5ec8ef588b
