I found some "flywheel bolt" with "special specs" on webone. Even though I am convinced that the 6.7 flywheel has 3/16 bolt, it was not a good idea. First, the head was the wrong diameter, it was too large. Second, the threads were not what I expected. I searched their specs again and found a specification for the 6.5. Just in case, I submitted two email to their customer service to get the correct specs for our application. Replacement of head gasket. Its the only part of the engine that I can remember taking apart. Never did it on a boat. Cheap to replace. Have had plenty of time to practice on other engines. You can buy a gasket kit that you can install on engine and while the engine is running tighten bolts with new studs. Take gaskets out and repack pack the heads off the engine. Close the engine after the gasket is installed and gaskets off and reseal the head gasket. Or put the gasket on while the engine is running. If done correctly gaskets will seal well. Have found that the corners of the gasket get worn and to compensate use a gasket that will take the wear. Have replacement flywheel on a 2003 chev tractor with the flywheel came off when I opened the cover to put in a new battery. Put new flywheel on and closed the cover and bolt. Started to close the cover and the flywheel spun off. Did not seem to be able to drive it with flywheel on. Hole in the flywheel seemed bigger than it should be. Dropped flywheel on the flywheel bolts and opened up the cover. Pulled right side drive plate off. Found flywheel spinning freely and no bolts holding in place. Dropped flywheel to the ground. Was able to drive tractor with drive plate off. So if you need to get the flywheel off on a tractor or for other reason do not have quick disconnect then drop the flywheel. Pull off drive plate and spin freely. Then remove bolts to keep the flywheel on. I had already removed the drive plate.
