Hi all, I have recently been visiting an

international client and one of my colleagues brought his baby daughter with him (7 months old). For the past few days she has been diapered, and has been using the changing table on a table by the side of the sofa. She's sleeping on her back in a large high-backed armchair, and is happy to stay in this position. The client is well-meaning and enthusiastic, but it's sometimes a bit awkward to change her as she is falling asleep. I'm not sure how best to handle this. Can anyone suggest a possible strategy? Finnley (the client) is only on maternity leave for 4 weeks, and it's his first child. As the daughter is still

diapered and asleep when he gets home from work, he doesn't want to risk waking her up. He's often changing her with the help of a breast-feeding partner, or else feeding her from the side of the sofa. She's been changing very well and is pretty relaxed about it. At the moment he's basically always changing her in the same way: placing her on the changing table with her back to him and lying her down in the chair. He then sits on the floor behind the table and gently lifts her from the table and sits her up in the chair with her back to him. He's very careful not to disturb her position and she stays pretty

relaxed. I haven't been too happy about this, but I'm feeling it's the best way as he is happy with the care and gets some reward. He said it's a bit of a battle keeping her calm and happy when she wakes from being put to sleep. It's definitely not a comfortable way to do it but it's obviously the most patient thing to do. He's always very gentle and says if she wakes up he just stops and waits for her to settle again. I'm wondering if anyone can suggest a better way of changing a baby in this situation (as she's very happy to sleep in 2edc1e01e8

What's New In Straylight?

What is Straylight? Straylight is a unique monophonic granular synthesiser for iOS that allows you to create atmospheric, expressive, and organic sounds from single-shot

audio recordings. How does Straylight work? Straylight is based on the granular synthesis paradigm, which consists of splitting an audio signal into many small sound fragments (“grains”) and then using these fragments to reconstruct the original sound. Straylight does this with a unique “wavetable” technology, which allows you to produce sounds ranging from creepy and dry to beautiful and sweet. Any limitations? Straylight’s limitations are its lack of integrated effects, modulation options, and arpeggiator. However, the price is right and Straylight does have a wide range of presets. Who is Straylight for?

Straylight is for people who love to create natural-sounding and textured sounds from single-shot audio recordings. What do you mean by single-shot? A “single-shot” audio recording is a musical phrase that is recorded once and played back exactly the same. This “single-shot” quality is achieved by using a soft synthesis engine and a dedicated audio interface with single-shot buffers. Is Straylight really like analog synthesizers? No, Straylight is not like an analog synthesizer. Analog synthesizers are based on analog signal processing. Instead, Straylight uses digital signal processing, which means it

can produce a wide range of sounds with a good amount of flexibility and character. What kind of sounds can you create? Straylight can create sounds ranging from creepy and dry to beautiful and sweet. How many parameters can I assign?

Straylight's sound engine has 20 parameters, but you can also use the app's undo and redo features. Do you need a Mac or Windows machine? Straylight runs on both Mac and Windows machines.
