Leatherman Bandolier (minimal spartan style backback) [Folding Tool] Smartwatchmaking - Folding backbackWatch with folding LCD The ExoMars Rover The ExoMars rover is the first Mars exploration rover to have all-wheel drive and arm-mounted miniature drill. The ExoMars rover will land on the surface of Mars using a technique known as "Mars surface drives" and operate on the planet's surface for one Martian year.[11] This is equivalent to two Earth years.[12] The ExoMars mission will be an unprecedented scientific endeavour.[13][14] In 2019, the mission was selected for launch in the 2020s by the Russian space agency Roscosmos.[15] The European Space Agency has also agreed to contribute €900 million to the mission. The rover will be launched from Baikonur Cosmodrome on a Proton-M launcher[16] with a scheduled liftoff date of February 18, 2020, at 04:57 UTC.[17] The project to send the rover to Mars was approved by the European Space Agency's Science Programme Committee, ESA's Roscosmos, and the European Space Agency's member states on April 14, 2005.[18] The planned launch date is 12 February 2018, though this was extended by 16 March 2018. There are no fixed launch dates for the mission since launch is dependent upon favourable meteorological conditions. On 30 July 2017, Roscosmos allocated 7.6 million euros to support the development of the launch services for the ExoMars mission.[19] The ExoMars mission consists of a lander and a rover.[3] The mission is led by the German Aerospace Center. The ExoMars flight programme is funded by the European Space Agency (ESA). The ExoMars mission is designed to search for signs of life, past and present, on Mars. It will use a surface operation and exploration rover called the "Mars Science Laboratory".[3] The spacecraft will land near Schiaparelli Crater, the landing site of the 2011 Mars Science Laboratory lander. This rover is smaller than the Curiosity rover, which is usually the size of a car, and has only two wheels. The main goal of the ExoMars program is to learn about Mars by testing instruments and studying the surface. The lander will collect and return a sample of Martian rock to Earth for further analysis. A
