Lightroom is a must sign up for professionals who work in any type of post production studio. From the basic user experience to the quality of the intergrated tools, the ability to import a broad range of file types, and the simple and efficient organization, Lightroom is the answer for any post production need. Lightroom users, such as photo editors, sports photographers, builders, and even graphic designers, are served by an all in one photo software that is an excellent resource for editing, organizing, and sharing. The photo editing software, Photoshop CS6, comes with a lot of new tools and features. The new human-tweakable layer tools are particularly welcome additions. In truth, though, I did not find the new version to be a great upgrade at all. I also found to be very slow and frustrating to use. On the other hand, the CS6 edition of the software is intended for people who are familiar with the computerization of the process of making photos. I do not recommend it to those who work without predecessors. In short, the biggest improvement in the user experience of Photoshop is the use of tabs and the iconized layer panel. On top of that, Photoshop CS6 includes filters, focal-plane guided edits and the Content Aware Fill feature. But, I found that the top image quality was just okay in spite of all this. For the most part, it seems to be composed of good and clean photographs, but not in a very high fashion. I nevertheless cannot but admire the way photographs look. They have a lot of photo emulsion, and that really looks nice. My favorite is an image of a winter landscape. It is an uncompromising picture in terms of composition and light. The photograph was taken in Norway on a cold winter day; the photographer was happy to make a test picture and show it for another day.
